This?**

Inside a Mound

Outside a Mound

- ◆ The three components of a mound system are a septic tank, pump station and the elevated mound.
- ◆ Mounds need established grass to help prevent erosion.

- ◆ Because a large portion of the mound system components are above-grade, mound systems are easier to construct than conventional soil absorption systems.
- ◆ Mound systems have been successful in treating wastewater on: slowly permeable soils; shallow permeable soils over bedrock; and permeable soils with seasonal high water tables.
